TestNG is a testing framework inspired from JUnit and NUnit but introducing some new functionalities that make it more powerful and easier to use, such as:

- Annotations
- Run your tests in arbitrarily big thread pools with various policies available (all methods in their
 own thread, one thread per test class, etc...).
- Test that your code is multithread safe.
- Flexible test configuration
- Support for data-driven testing (with @DataProvider).
- Support for parameters.
- Powerful execution model (no more TestSuite)
- Supported by a variety of tools and MOON-phsg-linkin(SelipSEAIDEA)-eMayan, etc...).
- Embeds BeanShell for further flexibility
- Default JDK functions for runtime and logging (no dependencies).
- Dependent methods for application server testing.

TestNG is designed to cover all categories of tests: unit, functional, end-to-end, integration, etc..
